

Transition elements

Transition element:

An element in the _____ that forms an _____ with an _____.

The transition elements have the following _____ properties:

Are _____.

Good _____.

Have _____ melting and boiling points.

The transition elements have the following _____ properties:

Form compounds in more than _____.

Form _____ compounds.

Act as _____ either the _____ or a _____ of the element.

Form a variety of _____.

Transition elements

Electronic structure

Elements	Electronic configuration	Oxidation states of its ions
Sc	[Ar] 3d ¹ 4s ²	+3
Ti	[Ar] 3d ² 4s ²	+1, +2, +3, +4
V	[Ar] 3d ³ 4s ²	+1, +2, +3, +4, +5
Cr	[Ar] 3d ⁵ 4s ¹	+1, +2, +3, +4, +5, +6
Mn	[Ar] 3d ⁵ 4s ²	+1, +2, +3, +4, +5, +6, +7
Fe	[Ar] 3d ⁶ 4s ²	+1, +2, +3, +4, +5, +6
Co	[Ar] 3d ⁷ 4s ²	+1, +2, +3, +4, +5
Ni	[Ar] 3d ⁸ 4s ²	+1, +2, +3, +4
Cu	[Ar] 3d ⁹ 4s ¹	+1, +2, +3
Zn	[Ar] 3d ¹⁰ 4s ²	+2

Why can most transition elements form variable oxidation states?

They easily lose their electrons to form . They have similar size and consequent . This means the ions are in a variety of oxidation states.

Why are Zn and Sc not considered transition elements?

Transition elements as a catalyst

As . They can use their to other species onto the metal's surface. This the bond of the adsorbed species. This the activation energy hence the rate of a reaction. The products from the surface of the metal.

Transition elements

Four examples are:

in the Haber process.

in catalytic converters of car exhausts.

in the hydrogenation of alkenes.

in the decomposition of hydrogen peroxide.

Transition metals can also act as catalysts. The catalyst ion usually changes its oxidation state during the reaction and is converted back to its original state at the end of a reaction.

An example is the use of vanadium(V) oxide in the contact process.

Coloured compounds:

Transition metal ions themselves are often coloured. ! But they do form coloured compounds. An example is when a transition metal ion is attached to ligand molecules e.g. with vanadium

Transition elements

Colour changes arise because of $d-d$ transitions, of the d orbitals. The reason why they are coloured is complicated and not required for OCR, however it is to do with an electron being promoted (given more energy) and promoted to a higher energy level. The energy that is not used by the electron, is seen as light.

Transition metals and complex ions:

Complex ion: An ion in which a number of ligands or anions are bound to a central metal ion by coordinate bonds.

Or a central metal ion surrounded by ligands.

Ligand: A molecule or ion that has at least one lone pair of electrons that bonds to a central metal ion through a coordinate bond.

Co-ordinate bond: A bond formed between the central metal ion and a ligand. When both the metal ion and the ligand come from the same atom.

Co-ordination number: The number of ligands attached to the central metal ion.

Transition elements

Shapes of complexes:

Co-ordination number	Name of shape	Bond angle	Example

often form ligands such as and

and ligands such as often form

Transition elements

Monodentate: Form only
metal ion e.g.

co-ordinate bond with the central

Bidentate: Form
e.g.

co-ordinate bond with the central metal ion

Multidentate/polydentate: Form
co-ordinate bonds with the central metal ion e.g.

or

Stereoisomerism in transition metal ion complexes:

Transition metal ion complexes can exhibit
and .

Cis/trans (E/Z)

In

structures:

Transition elements

If the bond angle of _____ is _____ then
the _____ or _____ isomer forms.

If the bond angle of _____ is _____ then
the _____ or _____ isomer forms.

Cis-platin:

Cis-platin is a _____ drug. Only the _____ version of the
structure will work as the _____ ions are displaced and the molecule
bonds with _____. This stops the replication of cancerous cells.

Transition elements

In _____ structures:

If the bond angle of _____ is _____ then
the _____ or _____ isomer forms.

If the bond angle of _____ is _____ then
the _____ or _____ isomer forms.

Optical isomerism:

_____ complexes can form optical isomers. They can only occur
with _____ ligands e.g. _____

Transition elements

Ligand Substitution

Ligands that are attached to a transition metal ion can often be replaced by another ligand, this is known as ligand substitution. This usually occurs because the substituting ligand has a higher affinity for the metal than the original ligand.

Reaction with ammonia:

Ammonia and water ligands are small in size therefore the coordination number does not change.

Reaction with chloride ions:

Using a high concentration of chloride ions such as in conc. hydrochloric acid or saturated sodium chloride solution. Because chloride ligands are larger, there is usually a change in coordination number from 6 to 4.

Colours of hexaaquaion transition metal ion solutions

Aqueous transition metal ion solution	Colour
$[\text{Cr}(\text{H}_2\text{O})_6]^{3+}$	
$[\text{Ni}(\text{H}_2\text{O})_6]^{2+}$	
$[\text{Fe}(\text{H}_2\text{O})_6]^{2+}$	
$[\text{Fe}(\text{H}_2\text{O})_6]^{3+}$	
$[\text{Co}(\text{H}_2\text{O})_6]^{2+}$	
$[\text{Cu}(\text{H}_2\text{O})_6]^{2+}$	

Transition elements

Haemoglobin and oxygen transportation:

Haemoglobin (a complex containing Fe^{2+}) transports oxygen around the blood. This is done by the oxygen binding to the haemoglobin through a coordinate bond. The oxygen replaces a water ligand. Fe^{2+} can form a weak coordinate bond. This means the Fe^{2+} cannot be transported through the blood.

Precipitation reactions:

Precipitation reactions occur when Fe^{2+} ions are added to a solution of hydroxide ions. The hydroxide ions can be added by either adding NaOH or NH_3 to the solution.

Why can we use $\text{NH}_{3(aq)}$?

The reactions that occur are as follows:

Transition elements

Table for ions that can be tested:

Ion	Reaction	Colour of precipitate

Transition elements

Adding aqueous ammonia to aqueous copper ions:

Two observations will be seen

1. The _____ ppt will be observed.
2. When _____ ammonia is added to this solution. The _____ will dissolve and form a _____ solution

A similar reaction with _____ occurs:

Transition elements
